Stock price Prediction of TCS using LSTM Neural Networks:

```
## import essential libraries
import pandas as pd
import numpy as np
%matplotlib inline
import matplotlib.pyplot as plt
import matplotlib
from sklearn.preprocessing import MinMaxScaler
from keras.layers import LSTM,Dense,Dropout
from sklearn.model_selection import TimeSeriesSplit
from sklearn.metrics import mean_squared_error, r2_score
import matplotlib.dates as mdates
from sklearn import linear_model
from math import sqrt
from statsmodels.tsa.arima.model import ARIMA
```

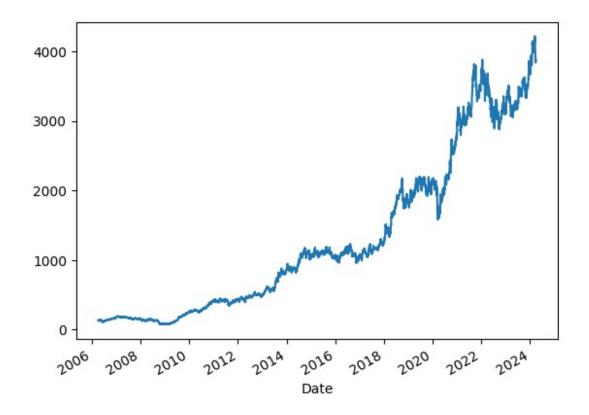

Reading data using parse date

As it is timeseries data so we have to read the data by parsing date means making data column as index.

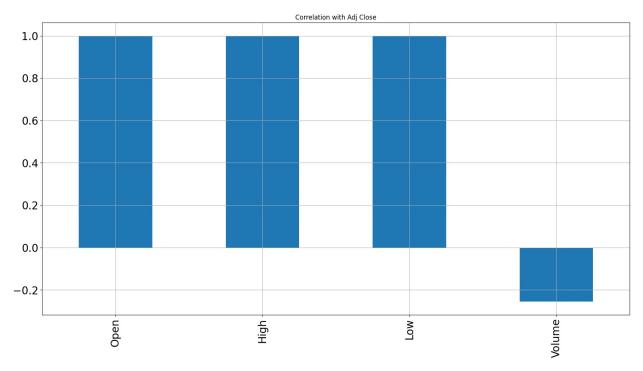

```
## read csv file
df final =
pd.read csv("TCS.csv",na values=['null'],index col='Date',parse dates=
True,infer datetime format=True)
df final.head()
{"summary":"{\n \"name\": \"df_final\",\n \"rows\": 4444,\n

Evaluation of Model

Predictions made by LSTM

```
score_lstm= model_lstm.evaluate(X_tst_t, y_test, batch_size=1)
```

LSTM's Prediction Visual

```
## Plot to visualize the accuracy
plt.plot(y_test, label='True')
plt.plot(y_pred_test_LSTM, label='LSTM')
plt.title("LSTM's_Prediction")
plt.xlabel('Observation')
plt.ylabel('INR_Scaled')
plt.legend()
plt.show()
```

Converting Prediction data

In this step I have made the prediction of test data and will convert the dataframe to csv so that we can see the price difference between actual and predicted price.

```
col1 = pd.DataFrame(y_test, columns=['True'])

col2 = pd.DataFrame(y_pred_test_LSTM, columns=['LSTM_prediction'])

col3 = pd.DataFrame(history_model_lstm.history['loss'],
    columns=['Loss_LSTM'])
    results = pd.concat([col1, col2, col3], axis=1)
    results.to_excel('PredictionResults_LSTM_NonShift.xlsx')
```

Conclusion

It is impossible to get a model that can 99% predict the price without any error, there are too many factors can affect the stock prices. So, we cannot hope there is a perfect model, but the general trend of predicted price is in line with the actual data, so the trader could have an indicator to reference, and makes trading decision by himself.

Further, we can improve the model's accuracy by increasing the epochs, trying out different activation functions or even change the model's structure. As exact
